

PROTECTOR Gate

Mobile, **PROTECTOR Gate** systems secure entrances and exits to buildings and encampments in an easy and effective way. They were developed based on PROTECTOR Mobile Barrier and PROTECTOR Ball.

Outer elements of **PROTECTOR Gate** form pyramids composed of PROTECTOR Balls permanently joined with each other. The number of spherical entanglements can vary depending on the width and height of the pyramids.

Elements in the upper part of vertical props installed in PROTECTOR Ball enable the movement of mobile gate arm, to which the PROTECTOR Mobile Barriers of appropriate size are attached.

PROTECTOR Gate System allows locking entrance or exit completely or partially. It is a very important and efficient element of securing different objects and stopping intruders. **PROTECTOR Gate** systems can be used with alarm systems or electric deterrent systems.

The assembly of **PROTECTOR Gate** is very quick and simple.
